Lab 6

Start with the code in `~gd.iyer/cs162/labs/lab6`. You will want to copy it into a directory of your own.

Implement LinkedList class specified in list.h in list.cpp.

You can build the app using the `make` utility, which is supported by the file named `makefile` provided in the directory.

For lab 6 submission, copy the implementation for **bool add(int val)** function into lab6.txt, then append the output of the app to the file using the command line below. ftp lab6.txt to your local machine and upload it to the Desire2Learn dropbox.

./app >> lab6.txt
